Is toe	How I fixed the issue	Evidence (Key Words)
Example	*"At first, when I clicked the Add button, nothing happened. I realised I forgot to connect the command= in the Button to the function. I fixed this by adding command=add_task."*	***command = function()***
5	At first when I was testing the condition where the player gains a point from eliminating a player, it happened to not relay points for the host for the server. I had noticed that this was because I was accidentally processing authority over labels through the use of strings rather than integers therefore comparing two improper types of data. Therefore I fixed this by changing the data type when collecting the player authority	**var player_index := GameManager.players.find(player.name)** **var player_index := GameManager.players.find(player.name.to_int())**
10	At first when I tried to leave the game through meeting the win condition, I noticed that when I had left as the host, the client would have errors since it was still connected to the hosted server that did not exist, there was also the issue regarding the global variables not resetting upon player reinstantiation. Therefore I fixed this by properly announcing the state upon each variable upon ready of the game startup.	**func _ready() -> void:** **Input.mouse_mode = Input.MOUSE_MODE_VISIBLE** **---** **func leave_server() -> void:** **if tube_enabled:** **tube_client.leave_session()** **multiplayer.multiplayer_peer.close()** **multiplayer.multiplayer_peer = null** **clean_up_signals()** **players.clear()** **player_list_updated.emit(players)** **get_tree().reload_current_scene()**
12	At first I noticed that the host would not relay its scores to other clients having a mismatch in score. This was because I had incorrectly refrerenced the players using a string value rather than an integer for easier handeling. Therefore I fixed it by making all computation regarding an interger handle rather than string	**GameManager.players.append(name.to_int())**

13	At first when I had retested the mouse usage, I had noticed that the mouse no longer changed its colour regarding the authority of the client. I noticed that due to the change in the reference of players, I had to ensure that the other lines of code treated that int value properly. Therefore I had changed the reference to int here as well ensuring that the player index was a integer reference and therefore would not cause a incorrect reference from a previous string value	**func _ready() -> void:** **Input.mouse_mode = Input.MOUSE_MODE_HIDDEN** **if multiplayer.is_server():** **var player_index = GameManager.players.find(int(name))** **colour_change.rpc(player_index)**
14	At first when testing the replayability, I noticed that even though a player had won it did not directly transfer to the win screen. This was because I had not made the condition to peroperly transfer to the win conditon widget gui for the user to see. Therefore I fixed this by creating a signal that would detect when the final player is left on the batttle field	**get_tree().current_scene.player_elim.connect(elimination_proceed)**
